Dear SeeByte team,

I am writing to apply for the job of Software Test Engineer. My name is Yasha Duncan-Wilson, and I'm a self-taught developer working primarily in Python but with significant previous experience of SQLite and JS, and some experience of embedded C++. While I have no formal professional experience, I have undertaken small projects for clients in the past with success.

Currently, I am postponing my studies at Heriot-Watt university for medical reasons, and hope instead to build upon my experience by finding a position where my willingness to learn new technologies and operate in a role fits and compliments the existing team. I have previously been described as 'self-motivated' and 'a results-focused individual' and am equally comfortable working as part of a team or independently.

Though I have no formal qualifications in testing, as the team lead of the Heriot-Watt CanSat Team I was proud to introduce Root Cause Analysis and Failure Mode and Effects Analysis methodologies to the team, as well as pioneering new methods of testing components. Thinking about potential failure modes is second nature to me, and my detail-oriented and analytical thinking style mean I often spot potential failures and causes early. Though I don't have experience of C# or Java, and only limited experience of C++ in embedded domains, I'm familiar with other programming languages and am always enthusiastic about the opportunity to pick up new frameworks and technologies. I also pride myself on my ability to communicate with stakeholders in both technical and non-technical contexts.

I hope this shows that I'm a good fit for the role - requirements focussed, detail-oriented and analytical, but always happy to explain my thinking or ask for other perspectives on issues, and designing and implementing testing systems.

Thank you for your time and consideration,
Yasha Duncan-Wilson
